Pedique Cosmetic Toenail Enhancement

Before

After

What is a cosmetic toenail replacement?

Pedique is a Prosthetic Nail Replacement. Although it is similar to gel false fingernails it uses a different formula to ensure maximum flexibility to withstand everyday shoe pressure and is designed specifically for toenails. This product is a long lasting, safe, non-toxic, and comfortable cosmetic treatment covering unsightly nails that can last up to a few months and grows out with the toenail. This is not the same as beauty salon nails which do not allow natural moistures through and can lead to further damage. Including making the natural nails too brittle. Pedique allows natural moisture through and inhibits fungal nail problems.

What can it be used for?

Pedique is ideal for any unsightly nail and can be attached to any amount of nail (although there must be some nail present.) It is an ideal option when part of the nail has been removed for any reason (eg fungal nail infection) and for nails that are simply unsightly either through thickening or trauma damage. Damage can happen to toenails at any time due to the wrong shoes, sports injuries and simply stubbing them on furniture. Pedique is ideal whether the problem is temporary or permanent. It will obviously need re-applying if the toenail has been permanently disfigured. However, we do not recommend continuous use of pedique since permanently covering any nail finger or toe is not ideal and could damage the nail in the long term.

When applied as part of a fungal nail treatment it helps keep the toenail healthy by acting as an inhibitor against further fungal infection on that toe. Pedique alone will not cure fungal nail, the damaged or thickened area needs removing first. It is normal for the nail to be partially thinned and discoloured areas

removed prior to Pedique gel being applied. It is recommended that an anti-fungal or fungistatic treatment is used in conjunction with a cosmetic enhancement.

The procedure is painless. The length of time it takes to prepare the area and apply the gel, allowing it to set hard, can vary greatly but can be as little as 20 minutes depending on the amount of initial work needed on the nail.

A mixture of gels will be blended to provide a relative colour match to create as natural appearance as possible. The gel will be built up in layers with each coating set under a UV lamp. Before you leave, the nail will be fully hardened and shaped to match as near as possible your other toenails.

It will certainly look better than the natural, damaged nail. It can also help with the initial soreness when part of the nail has been removed as it seals the surface far better than a plaster. Pedique is suitable for men and women.
